# 15-441/641: Computer Networks Intradomain Routing

15-441 Spring 2019 Profs **Peter Steenkiste** & Justine Sherry

Fall 2019 https://computer-networks.github.io/sp19/

# **Outline**

- · IP design goals
- · Traditional IP addressing
  - Addressing approaches
  - · Class-based addressing
  - Subnetting
  - · CIDR
- · Packet forwarding

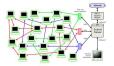

# So far you know how to build a Local Area Network

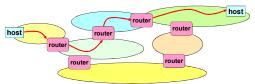

How do we get them to talk to each other?

# Logical Structure of an Internet

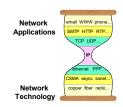

- · Interconnection of separately managed networks using routers
  - · Individual networks can use different (layer 1-2) technologies
- · Packet travels from source to destination by hopping through networks
  - "Network" layer responsibility
- · How do routers connect heterogeneous network technologies?

# Solution: Internet Protocol (IP)

- Inter-network connectivity provided by the Internet protocol
- Hosts use Internet Protocol to send packets destined across networks.
- IP creates abstraction layer that hides underlying technology from network application software
- · Allows range of current & future technologies
- WiFi, traditional and switched Ethernet, personal area networks, ...

# The Packet as an Envelope But need a local addressing header to travel between routers IP address identifies final destination Host wants to send... Local Address Header (Ethernet) To: Destination Host From: Sender Host IP Header To: 123.45.67.89 (Destination Host) From: 169.229.49.157 (Sender Host) HTTP Packet Payload: GET nyan.cat....

But need a local addressing header to travel between routers

IP address identifies final destination

Host wants to send...

Local Address Header (Token Ring)
To: Destination Host
From: Local Router

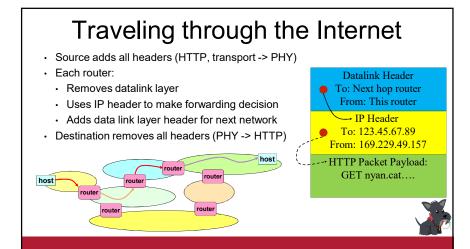

IP Header
To: 123.45.67.89 (Destination Host)
From: 169.229.49.157 (Sender Host)

HTTP Packet Payload: GET nyan.cat....

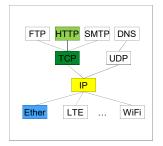

Datalink headers may differ across networks

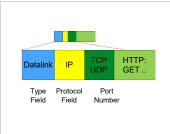

But IP header remains unchanged!

# **Protocol Demultiplexing**

• What layers do not need a protocol field?

# What are the Goals?

- LANs: "Connect hosts" → switching:
- "Wire" abstraction: behaves like Ethernet helps manageability
- · Only has to scale up a "LAN size"
- Availability
- Internet: "Connect networks" → routing:
  - · Scalability
  - Manageability of individual networks contributes to scalability
  - · Availability
- · Affects addressing, protocols, routing

# Outline

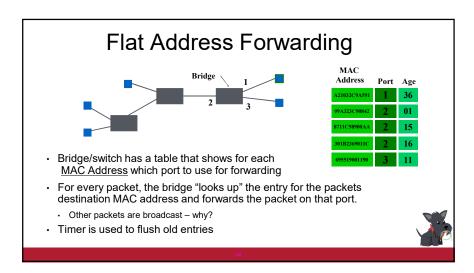

- · IP design goals
- · Traditional IP addressing
  - Addressing approaches
  - · Class-based addressing
  - Subnetting
  - · CIDR
- · Packet forwarding

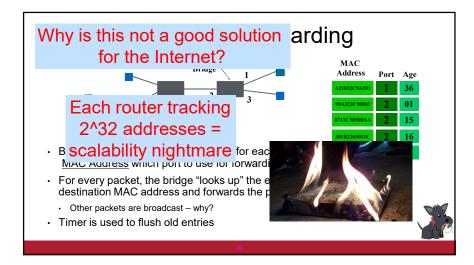

# Addressing and Forwarding

- · Flat address space with smart routers
- · Packets carry destination
- · Routers know location of every host
- · Flat address space with dumb routers
- · Packet carries a path
- · Heirarchical Routing Space
  - · What we actually do in IP
- · (Table of virtual circuits ids)
- · More on this later, but not today

# Source Routing

- · List entire path in packet
  - Driving directions (north 3 hops, east, etc..)
- Router processing
  - · Strip first step from packet
  - · Examine next step in directions and forward
- · Defined for IPv4 but rarely used
  - End points need to know a lot about network
  - · Economic and security concerns
  - · Variable header size

# Hierarchical Addressing

- Flat addresses one address for every host
  - Peter Steenkiste: 123-45-6789
  - Does not scale router table size explodes
  - 630M (1/09) entries, doubling every 2.5 years
- · Why does it work for Ethernet?
- Hierarchical add structure
- Pennsylvania / Pittsburgh / Oakland / CMU / Gates / 9th fl / Steenkiste
- · Common "trick" to simplify forwarding, reduce forwarding table
- What type of Hierarchy do we need for the Internet?
  - How many levels?
- · Same hierarchy depth for everyone?
- · Who controls the hierarchy?

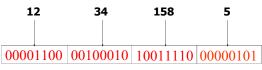

# IP Addresses (IPv4)

• Unique 32-bit number associated with a host

## 00001100 00100010 10011110 00000101

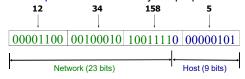

- · Represented with the "dotted quad" notation
- e.g., 12.34.158.5

# Hierarchy in IP Addressing

- · 32 bits are partitioned into a prefix and suffix components
- · Prefix is the network component: CMU
- · Suffix is host component: Prof. Sherry's laptop at CMU

- · Interdomain routing operates on the network prefix
- · Destination network operates on the host component

# History of Internet Addressing

- · Always dotted-quad notation
- · Always network/host address split
- But nature of that split has changed over time

# **Original Internet Addresses**

• First eight bits: network component

· Last 24 bits: host component

Assumed 256 networks were more than enough!

# IP Address Structure, ca 1981 Routers know how to get to network ID, but not individual hosts. Network ID 8 16 24 32 Class A 0 Network ID Host ID Class B 10 Class C 110

# IP Route Lookup, ca 1981

- · Address specifies prefix for forwarding table
- · Extract address type and network ID
- · Forwarding table structure reflects address structure
- · Logically, a separate forwarding table for each address class
- · For unicast address (classes A-C) entries contain
  - · The prefix for a destination network (length 8/16/24)
- · Information on how to forward the packet, e.g., exit port, ..
- www.cmu.edu address 128.2.11.43
- · Class B address class + network is 128.2
- · Lookup 128.2 in forwarding table for class B
- · Tables are still large!
- · 2 Million class C networks

# Outline

- · IP design goals
- · Traditional IP addressing

Class D

Class E 1111

- Addressing approaches
- · Class-based addressing
- Subnetting
- · CIDR
- · Packet forwarding

# Subnetting

- · Add another layer to hierarchy
- · Variable length subnet masks
  - · Could subnet a network internally into several chunks
- · Subnetting is done internally in the organization
  - It is not visible outside important for management

# Subnet Addressing RFC917 (1984)

- · Some "LANs" are very big
- Large companies, universities,  $\dots$
- · Internet became popular quickly
- · Cannot manage this as a single LAN
- · Hard to manage, becomes inefficient
- · Need simple way to partition large networks
  - Partition into multiple IP networks that share the same prefix called a "subnet", part of a network
- · CMU case study in RFC
  - Chose not to adopt concern that it would not be widely supported ©

# IP Address Problem (1991)

- Address space depletion
- Suppose you need 2<sup>16</sup> + 1 addresses?
- · Class A too big for all but a few domains
- Class C too small for many domains but they don't need a class B address
- · Class B address pool allocated at high rate
- · Many allocated address block are sparsely used
- · Developed a strategy based on a three solutions
  - · Switch to a "classless" addressing model this lecture
  - · Network address translation (NAT) later in the course
  - Definition of IPv6 with larger IP addresses next lecture

# Today's Addressing: CIDR

- · CIDR = Classless Interdomain Routing
- Idea: Flexible division between network and host addresses
  - Not limited to three sizes 8/16/24
  - · Prefix can be any size
- Motivation: offer a better tradeoff between size of the forwarding table and efficient use of the IP address space

# CIDR (example)

- · Suppose a network has fifty computers
- allocate 6 bits for host addresses (since 2<sup>5</sup> < 50 < 2<sup>6</sup>)
- remaining 32 6 = 26 bits as network prefix
- Flexible boundary means the boundary must be explicitly specified with the network address!
- · Informally, "slash 26" → 128.23.9/26
- Formally, prefix represented with a 32-bit mask: 255.255.255.255.192 where all network prefix bits set to "1" and host suffix bits to "0"

# Classful vs. Classless addresses

- · Example: an organization needs 500 addresses.
  - · A single class C address not enough (254 hosts).
- Instead a class B address is allocated (~65K hosts)
- · That's overkill, a huge waste!
- · CIDR allows an arbitrary prefix-suffix boundary
  - Hence, organization allocated a single /23 address (equivalent of 2 class C's)
- Maximum waste: 50%

# Hence, IP Addressing: Hierarchical

- · CIDR allows more efficient use of the IP address space
- Helps (at least for a while) with the high demand for IP addresses
- · But how does this help with the growth of forwarding tables?
  - · Number of destination networks is growing as well!
- · Solution has two complementary parts:
- · Allocation of IP addresses is done hierarchically
- Routers will combine forwarding entries for destinations "in the same general direction"

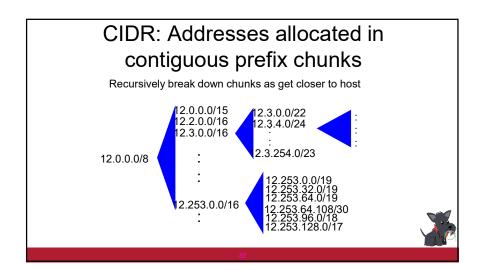

# **Allocation Done Hierarchically**

- · Historically assignment of prefixes was "first come first serve"
- With CIDR: Internet Corporation for Assigned Names and Numbers (ICANN) gives large blocks to...
- Regional Internet Registries, such as the American Registry for Internet Names (ARIN), which give blocks to...
- · Large institutions (ISPs), which give addresses to ...
- · Individuals and smaller institutions
- · FAKE Example:

ICANN → ARIN → AT&T → UCB → EECS

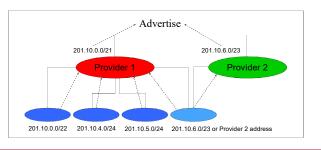

### IP Addressing → Scalable Forwarding? a.c.\*.\* is this way France AT&T Telecom a.0.0.0/8 a.b.\*.\* is this way LBL UCB a.b.0.0/16 a.c.0.0/16 · How many forwarding entries does France Telecom need for LBL/UCB destinations? Two · How about if all a.0.0.0/8 addresses are served by One AT&T - it "own" a.0.0.0/8, right? In practice, it is complicated ...

# CIDR Implication: Longest Prefix Match

· How to deal with multi-homing, legacy addresses, ...

## **How LPM Works**

- · Routing protocols aggregate forwarding entries to reduce table size
  - E.g., 3 forwarding entries A/B/C 01010011.xy/10 can be combined into 01010011/8 if they forward through the same port
  - · A fourth entry D that uses a different egress port has its own entry
- Works correctly because of longest prefix match (LPM)
  - Packets to A/B/C will match only the 01010011/8
  - Packets to D will match entries but will prefer the short "/10" entry
- · Legacy prefixes (e.g., 128.2) also often have their own entry

# Filling in Some Router Details

- · How do routing protocols learn the prefix size?
  - Routing advertisements include the prefix size; for destination addresses in packets, the prefix size is not relevant
- · For stub networks (subnetting): routers are configured by admin
- But a router now needs ~30 forwarding tables?
  - No forwarding uses a single tree data structure (called a trie)
  - · Very efficient algorithms exist for look up both in HW and SW
- · How do routers know the prefix size for destination addresses?
  - They do not need them because of how LPM look up works

# Outline

- · IP design goals
- · Traditional IP addressing
  - · Addressing approaches
  - · Class-based addressing
  - Subnetting
  - · CIDR
- Packet forwarding

# Host Routing Table Example

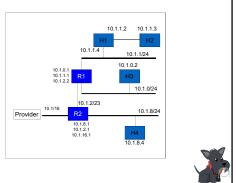

Destination	Gateway	Genmask	Iface
128.2.209.100	0.0.0.0	255.255.255.255	eth0
128.2.0.0	0.0.0.0	255.255.0.0	eth0
127.0.0.0	0.0.0.0	255.0.0.0	lo
0.0.0.0	128.2.254.36	0.0.0.0	eth0

- · From "netstat -rn"
- · Host 128.2.209.100 when plugged into CS ethernet
- · Dest 128.2.209.100 → routing to same machine
- · Dest 128.2.0.0 → other hosts on same ethernet
- Dest 127.0.0.0 → special loopback address
- Dest 0.0.0.0 → default route to rest of Internet
- · Main CS router: gigrouter.net.cs.cmu.edu (128.2.254.36)

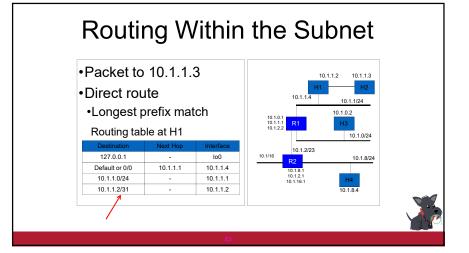

# Routing to the Network

- · Packet to 10.1.1.2 arrives
- Path is R2 R1 H1 H2
- H1 serves as a router for the 10.1.1.2/31 network

# Packet to 10.1.1.3 • Matches 10.1.0.0/23 Routing table at R2 | Destination | Next Hop | Interface | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.2 | 10.1.0.

### Routing Within the Subnet Packet to 10.1.1.3 10.1.1.2 10.1.1.3 Matches 10.1.1.2/31 Longest prefix match 10.1.0.2 Routing table at R1 10.1.0/24 Default or 0/0 10.1.2.1 10.1.2.2 10.1.2.0/23 10.1.2.1 10.1.2.2 10.1.0.1 10.1.0.0/24 10 1 1 0/24 10.1.1.1 10.1.1.2/31 10.1.1.4 10.1.1.1

# Important Concepts

- · Hierarchical addressing critical for scalable system
- Don't require everyone to know everyone else
- · Reduces number of updates when something changes
- Classless inter-domain routing supports more efficient use of address space
  - · Adds complexity to routing, forwarding, ...
    - · But it is Scalable!

# IP Addresses: How to Get One?

- · How does an ISP get block of addresses?
- From Regional Internet Registries (RIRs)
  - ARIN (North America, Southern Africa), APNIC (Asia-Pacific), RIPE (Europe, Northern Africa), LACNIC (South America)
- How about a single host?
- Assigned by sys admin (static or dynamic)
- DHCP: Dynamic Host Configuration Protocol: dynamically get address: "plugand-play"
  - · Host broadcasts "DHCP discover" msg
  - · DHCP server responds with "DHCP offer" msg
- · Host requests IP address: "DHCP request" msg
- DHCP server sends address: "DHCP ack" msg
